 Titusville FL 32796
 Open Mon-Sat, 10am to 4pm

nanosatellite. Other satellites and payloads include Oculus-ASR nanosatellite, GPIM, and the Deep Space Atomic Clock. To further research the payloads, Wikipedia.Org is recommended. The Falcon Heavy booster consists of three booster cores with 9 engines each. The two side boosters should return to a landing at the Cape Canaveral Air Force Station, while the central core booster should land on a barge in the Atlantic Ocean, too far from shore to be seen.

The STP-2 multi-manifest (rideshare) launch will demonstrate the capabilities of the SpaceX Falcon Heavy launch vehicle and provide critical data supporting certification for future National Security Space Launch (NSSL) missions, reducing the cost of launches for the U.S. government. In addition, Air Force Space Command will use this mission as a pathfinder for the development of mission assurance policies and procedures related to the reuse of launch vehicle boosters. The STP-2 payloads are assembled from a host of mission partners including the National Oceanic and Atmospheric Administration (NOAA), the National Aeronautics and Space Administration (NASA), DoD research laboratories, and university research projects. STP-2 provides a unique space access opportunity for DoD and inter-agency science and technology missions that directly enhance the space capabilities of the U.S. and its allies and partners. Included is COSMIC-2, a cluster of six satellites for NOAA. STP-2 will also host up to 8 CubeSat nanosatellites to be deployed, including E-TBEX, Launch Environment Observer (LEO), StangSat, PSAT, and TEPCE. Lightsail 2 will be carried by the Prox-1
