

The NROL-44 launch for the National Reconnaissance Office will utilize the Delta IV Heavy booster rocket which features three Common Booster Cores mounted together to form a triple-body rocket. The heavy-lift rocket will carry a classified National Reconnaissance Office payload into orbit, likely targeting a geosynchronous station more than 22,300 miles (nearly 36,000 kilometers) over the equator, where the NRO operates surveillance satellites capable of eavesdropping on foreign communication signals.
